

## Brain-storm

- \* We can store the zips for each course in their respective department folder. This should be done on a local server.

Every day

- \* Delete zips which haven't been downloaded recently ~~by tracking the last every day~~.

- \* Update <sup>zip</sup> files for courses which have been changed on the local server itself.

Doing this, we can avoid unnecessary management of zips that haven't been downloaded recently and unnecessarily large server loads for zipping large files.

**Note:** The time limit for which we do not delete a particular zip file can be pre-configured.
